Landing Gear Systems

Replacement for Mechanical Systems

ml55894tp_004.doc | 24SEP15

HWH offers direct replacement landing gear for most applications.

Additional jacks can be installed on the rear of the vehicle to replace scissor type stabilizing jacks.

No more pins to pull to extend landing gear, nor problems with pins sticking or breaking.

No cranking or keeping track of a special crank handle. (Even the HWH hand pump can be operated without a special handle.)

HWH hydraulic jacks give better stability than tube in tube landing gear or the rear scissor type jacks.

There is one central control panel instead of individual cranking handles.

There are fewer maintenance issues with no lubrication or greasing required.
