Two-Stage Hand Pump

ml55894tp_006.doc | 24SEP15

The control valve assembly is equipped with a two-stage hand pump which automatically shifts from high volume with low pressure to low volume with high pressure.

This provides a rapid extend or retract of the landing gear and leveling jacks with full lifting and leveling capabilities.

The hand pump can also be used to extend or retract any HWH room extension mechanism.

The hand pump systems are fully operable in the case of total electrical failure.

No drills or tools are necessary to operate the hand pump system.
